TAD : Graph

Representation: Adjacency list

Invariant: { V is a vertex  $\in G \land x$  is a vertex  $\in G \rightarrow x != v$  }

{ V is a list of adjacency of U, then  $U \in /V$ }

**Primitive operations** 

| Operation Name                   | Input          | Output    | Operation<br>Type |
|----------------------------------|----------------|-----------|-------------------|
| addVertex():                     | GRAPH X        | GRAPH     | MODIFIER          |
|                                  | ELEMENT        |           |                   |
| removeVertex(vertex):            | GRAPH X        | GRAPH     | MODIFIER          |
|                                  | ELEMENT        |           |                   |
| addEdge(sourceVertex,            | GRAPH X        | GRAPH     | MODIFIER          |
| destinationVertex):              | SOURCE_ELEMENT |           |                   |
|                                  | X DEST_ELEMENT |           |                   |
| removeEdge(sourceVertex,         | GRAPH X        | GRAPH     | MODIFIER          |
| destinationVertex):              | SOURCE_ELEMENT |           |                   |
|                                  | X DEST_ELEMENT |           |                   |
| BFS(startVertex)                 | GRAPH X        | STRING    | ANALYZER          |
|                                  | START_VERTEX   |           |                   |
| DFS(startVertex)                 | GRAPH X        | STRING    | ANALYZER          |
|                                  | START_VERTEX   |           |                   |
| Dijkstra(starVertex,finalVertex) | GRAPH X        | MAP       | ANALYZER          |
| -                                | START_VERTEX X |           |                   |
|                                  | FINAL_VERTEX   |           |                   |
| Floydwarhsall()                  | GRAPH          | INT [] [] | ANALYZER          |
